

### What's The Benefit of Live Plants Per Sq. Footage of Space?

- Choose one 10- to 12-inch potted plant per 100 square foot of your home for the most effective air purification.

The selection of the right plant for the right space go together. You cannot place a 1' plant next to a 12' window; the window would overpower the space and that is not recommended at all. Measuring the space is always recommended, to make sure the plant would be the right height and fullness for the right space.
